The Corporate Lending "Data Paradox"

Why Indian Banks Are Bleeding — The Scale of the Problem

Banks are paralyzed NOT by a lack of data — but an ABUNDANCE of it. A single mid-market appraisal touches 3+ data categories, 500+ documents, and dozens of external sources — yet 60% of analyst time is spent just preparing data, not analysing it.

Structured Data

- Bank statements (3+ years)
- GST: GSTR-1, 2A, 2B, 3B
- Balance sheets & P&L
- Cash flow statements
- Audit & compliance reports

Unstructured Data

- Annual reports (100s of pages)
- Board meeting minutes (scanned)
- Legal notices & MOU docs
- Promoter background files
- Sector analyst reports

External Intelligence

- MCA compliance & filings
- e-Courts litigation history
- RBI policy & macro signals
- News & reputational risk
- Industry NPA benchmarks

Fraud detection with AI

vs best-effort manual review

Intelli-Credit: The Solution Architecture

Three Specialized AI Pillars — Raw Data to Decision in Hours

01 Data Ingestor

The Engine Room

CIBIL & Annual Report OCR

Bounding-box extraction of CIBIL Rank 1–10 and debt schedules with 100% accuracy

GST Reconciliation Engine

Python math: GSTR-2A vs GSTR-3B cross-check. Flags ITC discrepancy to the rupee

Graph Fraud Analytics

networkx directed graph detects circular trading loops across 2,400+ transactions/case

500+ doc types processed

02 Research Agent

The Digital Analyst

e-Courts & MCA Scraping

BeautifulSoup scrapes promoter litigation, ROC compliance, director DIN validity

Macro Risk Monitor

Scans RBI circulars, SEBI alerts, financial news; weights sector-level credit headwinds

Human-AI NLP Portal

Credit officer field notes processed by LLM; risk signals extracted and dynamically weighted

Real-time external intelligence

03 Recommendation Engine

The Brain

Automated CAM (.docx)

Fully formatted bank-standard Credit Appraisal Memo. All 5 sections auto-populated

Five Cs Framework

Character, Capacity, Capital, Collateral & Conditions — each traceable to source data

Explainable AI (SHAP)

Every score deduction is labelled, sourced and auditable — fully RBI-compliant

XAI audit trail per decision

OUTPUT → CAM.docx + XAI Decision Log + Risk Score + Hours not Days + Bank-Compliant & Auditable

Pillar 1: The High-Latency Data Ingestor

Purpose-Built Pipelines — Replacing 100 Hours of Manual Data Prep

A — CIBIL & Annual Report Parsing

Generic OCR fails on Indian commercial docs — misread tables, merged cells, and scanned PDFs. Our pipeline uses bounding-box localization to extract CIBIL Rank (1–10), total outstanding debt, and repayment schedules with 100% accuracy.

→ 100% extraction accuracy

B — Programmatic GST Reconciliation

Python hardcodes the math: GSTR-3B (self-declared ITC) vs GSTR-2A (supplier-confirmed). Catches ITC inflation that no LLM can compute. Detects balance sheet inflation to the exact rupee.

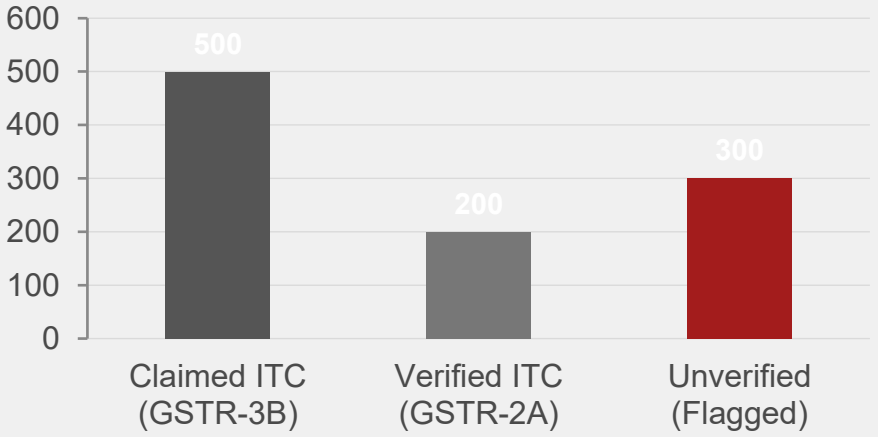
→ 100% discrepancy detection

C — Graph Analytics: Circular Trading

networkx maps every bank txn as directed graph nodes/edges. DFS cycle-detection finds closed money loops in milliseconds across 2,400+ transactions. Manual analysts catch <10% of these.

→ 90%+ fraud miss rate (manual)

GST ITC Reconciliation — Fraud Case



⚠ **INR 3,00,000 unverified ITC detected — probable tax evasion & artificial balance sheet inflation**

Circular Trading Detection — Live Stats

2,400+	<3 sec	5-hop	₹2.33 Cr
txns/case	loop detect	max chain	fraud caught

Graph Analytics: Detecting Circular Trading Fraud

Directed Graph Cycle Detection — Fraud Patterns Manual Analysts Miss 90% of the Time

How Circular Trading Works

1 Revenue Inflation
Company routes ₹ through shell entities to fabricate high turnover

2 Legitimate Façade
Each shell files GST returns — creating an aura of real trade activity

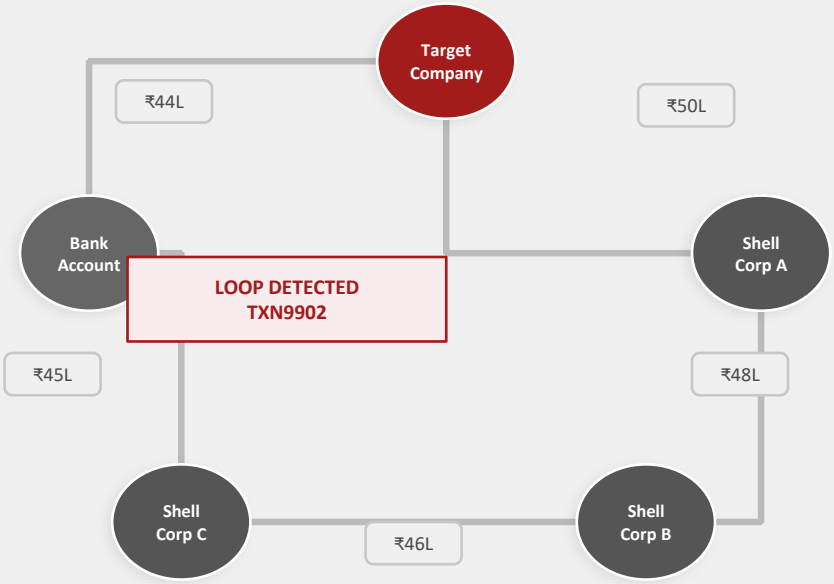
3 Analyst Blindspot
Manual analysts miss multi-hop cycles buried in thousands of txn rows

4 Loan Fraud Executed
Bank approves inflated loan based on fictional revenue — NPA follows

Detection Pipeline

① Ingest all bank transactions (CSV or parsed PDF)
② Build directed graph — entity=node, transfer=edge
③ Run DFS cycle-detection algorithm across full graph
④ Alert on loops where money returns to origin < 30 days

Live Detection — TXN Case #9902



₹2.33 Cr	5 Entities	18 Days	CRITICAL
Total Cycled	In Loop	Cycle Duration	Risk Rating

Pillar 2: The Autonomous Research Agent

While the Analyst Sleeps — AI Scrapes, Monitors & Dynamically Weights Risk

A. Web-Scale Secondary Research

BeautifulSoup + LangChain

⚖ e-Courts Portal

Queries entity + all promoters by DIN. Surfaces hidden vendor disputes, winding-up petitions, and RBI defaulter list hits.

MCA ROC Database

Checks filing compliance, delayed annual returns, charge registration, director DIN validity, strike-off risk.

Macro Risk Monitor

Scans RBI circulars, SEBI notifications, financial news. Correlates sector headwinds and NPA trends to risk score dynamically.

"AI monitors 100s of external sources simultaneously — a task that takes analysts 2–3 days manually."

B. Human-AI Insight Integration

NLP + Dynamic Weighting

● CREDIT OFFICER FIELD NOTE INPUT

"Factory production at 40% capacity. Power bills low vs same period. Inventory stagnant 4 months. Promoter evasive on order book and upcoming contracts."

NLP EXTRACTED RISK SIGNALS ↓

CRITICAL	**Capacity Risk** 40% utilisation → Capacity score −15 pts	**−15 pts**
HIGH	**Promoter Risk** Evasive behaviour flagged → Character −10 pts	**−10 pts**
MEDIUM	**Inventory Risk** Stagnant stock → Revenue quality concern −8 pts	**−8 pts**
LOW	**Order Book Gap** No future orders confirmed → Conditions −5 pts	**−5 pts**

Total NLP deduction: −38 pts from starting score

Pillar 3: The Recommendation Engine

Automated CAM Generation + SHAP-Based Explainable AI — Every Decision Auditable

Five Cs of Credit — Auto-Populated CAM Sections

C-FACTOR	DATA SOURCE & METHOD	PILLAR
Character	MCA filings, e-Courts promoter check, RBI defaulter list	P2
Capacity	DSCR, cash flow analysis, GST revenue reconciliation	P1
Capital	Net worth, D/E ratio extracted from Annual Reports (OCR)	P1
Collateral	Asset valuation, charge registration on MCA portal	P2
Conditions	RBI macro, sector NPA trend, covenant pre-population	P2

Output: CAM.docx

Fully-formatted bank-standard Credit Appraisal Memo — auto-populated with all 5 sections. Committee-ready in minutes. Zero manual formatting.

Explainable AI — Rejection Trace Log

-20	**GSTR-3B ITC > GSTR-2A** Self-declared ₹5L vs vendor-confirmed ₹2L — fabricated tax credit
-50	**Circular loop TXN9902** ₹2.33 Cr cycled across 5 entities in 18 days — critical fraud
-10	**Active promoter litigation** HC/2023/4471 — high-severity case not disclosed by applicant
-20	**40% factory utilisation** Field visit NLP: low capacity signals revenue inflation

20
/100
REJECT

✓ **RBI COMPLIANT**

SHAP-based score trace meets RBI's explainable AI guidelines. Every deduction labelled, sourced, and fully auditable by the loan committee.

Future Roadmap: Scaling to Production

From Hackathon Prototype to Enterprise-Grade Infrastructure — 4 Clear Phases

Phase 1

NOW

Prototype

Working prototype · Hackathon ready

- End-to-end CAM generation
- Mock Indian financial data
- Graph fraud detection live
- XAI trace log functional
- Full 3-pillar pipeline

Phase 2

3–6 mo

API Integration

Zero manual uploads

- Open Banking / AA APIs
- Real-time CBS data feeds
- Live GSTN API integration
- Automated data pull
- No manual file upload

Phase 3

6–12 mo

Deep Learning

Global shell detection

- Graph Neural Networks (GNNs)
- Multi-national holding maps
- UBO identification engine
- Beneficial owner tracing
- Complex fraud chains

Phase 4

12–18 mo

Full Production

Enterprise deployment

- Vernacular NLP (Hindi/Tamil)
- Post-disbursal monitoring
- Covenant breach alerts
- Continuous risk scoring
- Live bank deployment

Data & Parsing Layer

- Python 3.11, pandas, numpy
- OpenCV + Tesseract (OCR)
- networkx (graph analytics)
- BeautifulSoup4 (scraping)

AI & Intelligence Layer

- LLMs: OpenAI / Anthropic
- SHAP / XAI Principles
- LangChain (orchestration)
- GNN: PyTorch Geometric (v3)

Output & Integration

- python-docx (CAM output)
- Account Aggregator APIs
- FastAPI (REST interface)
- Core Banking System hooks

Thank You
